PROFESSIONAL SUMMARY

Cloud Security and SecOps Engineer specializing in threat detection, automated security workflows, and Governance, Risk, & Compliance (GRC). Transitioned from foundational network vulnerability assessments to architecting evidence-grounded AI security assistants and offline log monitoring systems. Proven ability to build practical security architectures using Python, Docker, and local RAG models. Focused on transforming manual security operations into automated, resilient code to protect critical infrastructure.

TECHNICAL SKILLS

- **Programming & Automation:** Python, Scripting, Automation, JSON, XML, HTML.
- **Cybersecurity & GRC:** Cloud Security, Network Security, Security Operations (SecOps), Vulnerability Assessment, Threat Detection, Event Correlation, Risk Assessment, Security Auditing, Linux Security.
- **Networking:** TCP/IP, OSI Model, IPv4, Subnetting, DNS, DHCP, Routing & Switching, Network Reconnaissance, Port Scanning, Socket Programming.
- **Security Tools & AI:** Nmap, Wireshark, Git, GitHub, Docker, Kali Linux, Streamlit, Ollama, RAG, Evidence-Grounded Analysis, Audit Logging.
- **Databases:** MariaDB, MySQL.

PROJECTS

KiroTrace — Cloud SecOps Log Monitoring & AI Security Assistant | *Python, Streamlit, Ollama, RAG, Docker*

- Built an offline-oriented SecOps monitoring and AI-assisted security analysis system with log aggregation, normalization, threat detection, and event correlation.
- Implemented evidence-grounded RAG, local security knowledge retrieval, controlled security-tool execution, policy enforcement, audit logging, output validation, session context, and Docker-based sandboxing.

Automated Firewall & ACL Rule Auditor | *Python, JSON, HTML, Tkinter, Kali Linux*

- Developed an automated firewall and Access Control List (ACL) auditing tool to identify risky, duplicate, conflicting, and misconfigured security rules.
- Evaluated rules against security best practices, performed risk assessment, and generated JSON and HTML reports for security auditing and review.

Network Service Enumeration Tool | *Python, Socket Programming, Multithreading, Kali Linux*

- Built a TCP service enumeration tool for authorized targets to identify open ports and common network services during network security assessment.
- Implemented socket-based scanning, timeout handling, service identification, and structured output for reconnaissance and vulnerability-assessment workflows.

Network Reconnaissance & Database Analyzer | *Python, Nmap, XML Parsing, MariaDB, Linux*

- Developed a Python-based network reconnaissance tool to parse Nmap XML scan reports and extract hosts, ports, services, and scan results for structured security analysis.
- Integrated reconnaissance data with MariaDB using relational database design for organized storage, querying, and repeatable network security assessment.

EDUCATION Bachelor of Science in Information Technology (BSIT) | University of Layyah, Pakistan |

Expected Graduation: 2028

- **Academic Standing:** CGPA 3.65 / 4.0
- **Relevant Coursework:** Computer Networks, Analysis of Algorithms, Programming, Database Systems, Linux, Cloud Security, GRC Fundamentals.
